

# Can Tweets Predict the 2020 Election?

The large map of the United States is a 2020 election prediction map using Donald Trump and Joe Biden as the Republican and Democratic candidates, respectively. The map was produced in QGIS, and the data was collected using RStudio to grab thousands of geo-tagged tweets (Twitter) within the mainland of the United States containing the hashtags “trump2020” and “biden2020” to compare overall share of tweets supporting Trump versus tweets supporting Biden per state. A categorized symbology represents correlation of support for a candidate. This prediction map is non-scientific and simply shows enthusiasm by use of Twitter, which may be skewed due to the general population that uses this social media platform.

"Joe Biden will appoint liberal federal judges and Justices rather than far-right radicals. Vote for him." #biden2020
